Package 'mSigAct'

August 22, 2022

```
Title Mutational Signature Activity Analysis ('mSigAct')

Version 2.2.2

Author Steve Rozen, Alvin Wei Tian Ng, Arnoud Boot, Nanhai Jiang

Maintainer Steve Rozen <steverozen@gmail.com>
```

Description Analyze the ``activities" of mutational signatures in one or more mutational spectra.
'mSigAct' stands for mutational Signature Activity. mSigAct uses a maximum likelihood approach to estimate (conservatively) whether there is evidence that a particular set of mutational signatures is present in a spectrum. It can also determine a *minimal* subset of signatures needed to plausibly reconstruct an observed spectrum. This sparse assign signatures functionality is *deliberately biased* toward using as few signatures as possible. There is also functionality to do a maximum a posteriori estimate of signature activity, which makes use of information on the proportion of tumors in a given type that have a particular signature combined with the likelihood that a particular combination of signatures generated an observed spectrum.

cossim

Index

Cosine similarity with useful argument types

10

Description

Cosine similarity with useful argument types

Usage

```
cossim(v1, v2)
```

Arguments

v1 A vector or single-column matrix v2 A vector or single-column matrix

Examples

DefaultManyOpts 3

DefaultManyOpts

Set default options for many functions, especially nloptr

Description

Set default options for many functions, especially nloptr

Usage

```
DefaultManyOpts(likelihood.dist = "multinom")
```

Arguments

```
likelihood.dist
```

The probability distribution used to calculate the likelihood, can be either "multi-nom" (multinomial distribution) or "neg.binom" (negative binomial distribution).

Value

A list with the following elements

global.opts A sub-list with several options for nloptr, q.v., for the global optimization phase.

local.opts A sub-list with several options for nloptr, q.v., for the local optimization phase.

nbinom.size Only appearing if likelihood.dist = "neg.binom". The dispersion parameter for the negative binomial distribution; smaller is more dispersed. See NegBinomial.

trace If > 0 print progress messages.

global_eval_f The objective function for the global optimization phase.

 $local_eval_f$ The objective function for the local optimization phase.

local_eval_g_ineq The inequality constraint function for the local optimization phase.

likelihood.dist The probability distribution used to calculate the likelihood.

Examples

```
my.opts <- DefaultManyOpts()
my.opts$trace <- 10</pre>
```

ExposureProportions

Return the proportions of tumors of a given cancer type that have a particular signature

Description

Return the proportions of tumors of a given cancer type that have a particular signature

Usage

```
ExposureProportions(
  mutation.type,
  cancer.type,
  all.sigs = NULL,
  drop.sigs.no.info = TRUE,
  must.include = character(),
  must.include.prop = 0.1
)
```

Arguments

The value used for the expected proportion of signatures in must.include but not previously observed in the given cancer.type.

Value

A numerical vector of the proportion of tumors of type cancer.type with each signature for those signatures observed in cancer.type. The names are the signature ids.

Examples

ReconstructSpectrum

Given signatures (sigs) and exposures (exp), return a spectrum or spectra

Description

Given signatures (sigs) and exposures (exp), return a spectrum or spectra

Usage

```
ReconstructSpectrum(sigs, exp, use.sig.names = FALSE)
```

SignaturePresenceTest 5

Arguments

sigs	Signature as a matrix or data frame, with each row one mutation type (e.g. CCT > CAT or CC > TT) and each column a signature.
exp	The exposures for one or more samples as a matrix or data.frame, with each row a signature and each column a sample.
use.sig.name	S
	If TRUE check that rownames (exp) is a subset of colnames (sigs), and

use only the columns in sigs that are present in exp.

Details

Does not care or check if colSums (sigs) == 1. Error checking is minimal since this function is called often.

Value

The matrix product sigs % * % exp after some error checking.

Examples

```
spectra <- PCAWG7::spectra$PCAWG$SBS96[, 1:2, drop = FALSE]</pre>
SBS96.sigs <- cosmicsig::COSMIC_v3.2$signature$GRCh37$SBS96
exposure <- PCAWG7::exposure$PCAWG$SBS96[, 1:2, drop = FALSE]</pre>
reconstructed.spectra <- ReconstructSpectrum(sigs = SBS96.sigs,</pre>
                                                exp = exposure,
                                                use.sig.names = TRUE)
```

SignaturePresenceTest

Test whether a given signature is plausibly present in a catalog.

Description

Test whether a given signature is plausibly present in a catalog.

Usage

```
SignaturePresenceTest(
 spectra,
 sigs,
 target.sig.index,
 m.opts = DefaultManyOpts(),
 seed = NULL,
 mc.cores = 2
)
```

Arguments

spectra	The catalog (matrix) to analyze. This could be an ICAMS catalog or a numerical matrix.
sigs	A catalog of signatures from which to choose. This could be and ICAMS catalog or a numerical matrix.
target.sig.i	ndex
	The index of the signature the presence of which we want to test. It can also be the signature id (e.g. "SBS22").
m.opts	See DefaultManyOpts.
seed	Random seed; set this to get reproducible results. (The numerical optimization is in two phases; the first, global phase might rarely find different optima depending on the random seed.)
mc.cores	Number of cores to use. Always silently changed to 1 on Microsoft Windows.

Value

A list of test results for each sample in spectra. Each sublist contains the following elements:

- loglh.with: The maximum log likelihood of the reconstructed spectrum using all the signatures.
- loglh.without: The maximum log likelihood of the reconstructed spectrum without the target signature.
- statistic: Likelihood ratio test statistic.
- chisq.p: P-value of the likelihood ratio test. The null hypothesis is we can plausibly reconstruct the spectrum without the target signature.
- exp.with: The exposure using all the signatures which generates the maximum log likelihood loglh.with.
- exp.without: The exposure not using the target signature which generates the maximum log likelihood loglh.without.

Examples

7 SparseAssignActivity 5 and 5 a

```
SparseAssignActivity
```

Find known signatures that can most sparsely reconstruct each spectrum in a catalog.

Description

Find known signatures that can most sparsely reconstruct each spectrum in a catalog.

Usage

```
SparseAssignActivity(
  spectra,
  sigs,
  output.dir,
  max.level = 5,
 p.thresh = 0.05,
 m.opts = DefaultManyOpts(),
 num.parallel.samples = 5,
 mc.cores.per.sample = min(20, 2^max.level),
 progress.monitor = NULL,
  seed = NULL,
 max.subsets = 1000,
  drop.low.mut.samples = TRUE
)
```

Arguments

```
The spectra (multiple spectra) to be reconstructed.
spectra
                  A numerical matrix, possibly an ICAMS catalog.
sigs
output.dir
                 Directory path to save the output file.
                  The maximum number of signatures to try removing.
max.level
                  If the p value for a better reconstruction with a set of signatures (as opposed to
p.thresh
                  without that set of signatures) is > than this argument, then we can use exposures
                 without this set.
m.opts
                 See DefaultManyOpts.
num.parallel.samples
                  The (maximum) number of samples to run in parallel. On Microsoft Windows
                 machines it is silently changed to 1. Each sample in turn can require multiple
                 cores, as governed by mc.cores.per.sample.
mc.cores.per.sample
                 The maximum number of cores to use for each sample. On Microsoft Windows
                 machines it is silently changed to 1.
```

```
progress.monitor
```

Function called at the start of each new level (number of signatures to try excluding). Must take named arguments value and detail, and no others. Designed for a AsyncProgress progress bar function.

seed

Random seed; set this to get reproducible results. (The numerical optimization is in two phases; the first, global phase might rarely find different optima depending on the random seed.)

max.subsets

This argument provides a way to heuristically limit the amount of time spent by this function. Larger values of this argument will tend to allow longer running times. The algorithm successively tries to remove all subsets of 1 signature, 2 signatures, 3 signatures, etc., down to max.level. (Not every subset is tested at each level; if a subset was already found to be necessary the algorithm does not test supersets of that subset.) If at any level the algorithm needs to test more than max.subsets this function will not proceed.

drop.low.mut.samples

Whether to exclude low mutation samples from the analysis. If \mathtt{TRUE} ($\mathtt{default}$), samples with SBS total mutations less than 100, DBS or ID total mutations less than 25 will be dropped.

Value

A list with the elements:

- proposed.assignment: The most sparse set of signatures that can plausibly explain spectra.
- proposed.reconstruction: The reconstruction based on sparse assignment.
- reconstruction.distances: Various distances and similarities between spectra and proposed.reconstruction.
- all.tested: All tested possible ways to reconstruct each sample in spectra.
- alt.solutions: A tibble showing all the alternative solutions that are statistically as good as the proposed.assignment that can plausibly reconstruct spectra.
- \bullet time.for.assignment: Value from system.time for running SparseAssignActivity for each sample in spectra.
- error.messages: Only appearing if there are errors running SparseAssignActivity.

The elements proposed.assignment, proposed.reconstruction, reconstruction.distances, all.tested, time.for.assignment will be NULL if the algorithm could not find the optimal reconstruction or there are errors coming out for all samples.

Examples

```
## Not run:
# This is a long running example unless parallel computing is supported on your machine
indices <- grep("Lung-AdenoCA", colnames(PCAWG7::spectra$PCAWG$SBS96))
spectra <- PCAWG7::spectra$PCAWG$SBS96[, indices[1:2], drop = FALSE]</pre>
SBS96.sigs <- cosmicsig::COSMIC_v3.2$signature$GRCh37$SBS96
sigs.prop <- ExposureProportions(mutation.type = "SBS96",</pre>
                                  cancer.type = "Lung-AdenoCA")
sigs.to.use <- SBS96.sigs[, names(sigs.prop), drop = FALSE]</pre>
sparse.out <- SparseAssignActivity(spectra = spectra,</pre>
                                    sigs = sigs.to.use,
                                    output.dir = file.path(tempdir(), "Lung-AdenoCA"),
                                    max.level = ncol(sigs.to.use) - 1,
                                    p.thresh = 0.05 / ncol(sigs.to.use),
                                    num.parallel.samples = 2,
                                    mc.cores.per.sample = 30,
                                    seed = 2561)
```
